

NEW FOR 2006

LEADING THE INDUSTRY WITH A MATERIAL THAT'S LIGHTER AND TOUGHER THAN SINGLE-LAYER POLYETHYLENE.

Innovative, unprecedented and, judging by early reactions, a big step in the 'light' direction for Old Town, our new Variable Layer boat material is nothing short of astonishing. Yet, the thinking behind it is very basic.

We know that kayaks require more stiffness in some areas, and less in others. So, any boat with one consistent layer of plastic will be over-built in some areas, or possibly under-built in the more critical areas — which means you're left with either a very heavy boat, or a flimsy one. So, we've given each area of the boat exactly the number of layers it needs, and eliminated the weight it doesn't.

Putting our years of experience with 3-layer polyethylene in action, we've created a technology that can produce an incredibly durable, well-constructed boat that keeps the weight down — well below any single-layer or 3-layer construction on the market today. About 10% lighter than single-layer polyethylene of the same stiffness, our new Variable Layer material represents the next evolutionary step in kayak construction.

You have to see it — better still, lift it — to believe it.

Dirigo 120 Recreational Kayak

Available on all Dirigo kayaks for 2006.

Cayuga 160 Touring Kayak

Available on all Cayuga kayaks for 2006.
